All outstanding tests passing.

Abstract method chosenPackage not included in Member class and thus Member class not made abstract to facilitate this. This has an impact on the nature of the Member class, allowing it to be used for real instances rather than concrete instances of PremiumMember and StudentMember only. It also means that the mock class required for testing Member was not created in the tests as described in the video provided for the assessment. An implementation of chosenPackage is provided in the Member class against the spec and does not reflect the intention of the method to set a package choice.

All functions appear to work correctly, XML loading and persistence mechanisms work, and model classes contain the required methods (with the exception of that noted above).

Nice additional features implemented such as messaging for requests.

Extra presentation feature on menu including ASCII art, icons for options are very well done.

An excellent project overall.
